

CLONE WARS-INSTRUCTIONS

Cross, Daniel

[COMPANY NAME] [Company address]

Introduction

In this project you'll learn how to create a game in which you have to save the Earth from space monsters.

Step 1: Making a Spaceship

Let's make a spaceship that will defend the Earth!

Activity Checklist

- Start a new Scratch project and delete the cat sprite so that your project is empty. You can find the online Scratch editor at jump10.cc/scratch-new.
- Add the 'stars' backdrop and the 'Spaceship' sprite to your project. Shrink the spaceship and move it near the bottom of the screen.

- Add code to move your spaceship to the left when the left arrow key is pressed. You'll need to use these blocks:

- Add code to move your spaceship to the right when the right arrow key is pressed.
- Test your project to see whether you can control your spaceship with the arrow keys.

Save your project

Step 2: Lightning bolts

Let's give the spaceship the ability to fire lightning bolts!

Activity Checklist

- Add the 'Lightning' sprite from the Scratch library. When the game is started, the lightning should be hidden until the spaceship fires its laser cannons. The sprite needs to be much smaller and upside down. Add the following code to the 'Lightning' sprite.

- Add the following code to the 'Spaceship' to create a new lightning bolt whenever the space key is pressed.

- Whenever a new clone is created, it should start in the same place as the spaceship, and then move up the stage until it touches the edge. Add the following code to the 'Lightning' sprite:

Note: We move the new clone to the spaceship while it is still hidden, before then showing it. This just looks nicer.

- Test your lightning, by pressing the space key.

Save your project

Challenge: Fixing the lightning

What happens if you keep the space key held down? Can you use a `wait` block to fix this?

Save your project

Step 3: Flying Space-hippos

Let's add lots of flying hippos that are trying to destroy your spaceship.

Activity Checklist

- Create a new sprite from the "Hippo1" image in the Scratch library.

- Set its rotation style to be left-right only, and add the following code to hide the sprite when the game starts:

- Create a new variable called `speed`, that is for the hippo sprite only.

You'll know if you've done this correctly because the variable will have the name of the sprite next to it, like this:

- The following code will create a new hippo every few seconds. The **Stage** is a good place for this code to live:

- When each hippo clone starts, make it move around the stage (at a random speed) until it gets hit by the lightning. Add this code to the **hippo** sprite:

- Test your laser cannon. If you hit a hippo, does it vanish?
- When a hippo touches your spaceship, we need to make the spaceship explode! To do this, first make sure that your spaceship has 2 costumes called 'normal' and 'hit'.

The spaceship's 'hit' costume can be made by importing the 'Sun' image from the Scratch library, and using the 'Color a shape' tool to change its colour.

- Add this code to your spaceship so that it switches costume whenever it collides with a flying hippo:

```

when clicked
  forever
    switch costume to normal
    wait until touching hippo
    switch costume to hit
    broadcast hi
    wait 1 sec
  
```

- Did you notice that you have broadcast a 'hi' message in the code above? You can use this message to make all of the hippos disappear when the spaceship is hit.

Add this code to your hippo:

```

when I receive hi
  delete this clone
  
```

- Test out this code by starting a new game and colliding with a hippo.

Save your project

Challenge: Lives and Score

Can you add a **lives**, **score** or even a **highscore** to your game? You can use the 'Catch the Dots' project to help you.

Save your project

Step 4: Fruit Bats!

Let's make a fruit bat that throws oranges at your spaceship.

Activity Checklist

- Firstly, make a new bat sprite that will **move** across the top of the stage **forever**. Remember to test out your code.

- If you look at the bat's costumes, you'll see that it already has 2:

Use the **next costume** block to make the bat flap its wings as it moves.

- Create a new 'Orange' sprite from the Scratch library

- Add code to your bat, so that it creates a new orange clone every few seconds.

```

when clicked
  forever
    wait pick random 5 to 10 sec
    create clone of Orange
  
```

- Click on your orange sprite and add this code to make each orange clone drop down the stage from the bat towards the spaceship:

```

when I start as a clone
  go to bat
  show
  repeat until touching edge
    change y by 2
  when I receive hi
    delete this clone
  
```

- In your spaceship sprite, you'll need to modify your code so that you are hit if you touch a hippo or an orange:

```

wait until touching hippo or touching Orange
  
```

- Test your game. What happens if you get hit by a falling orange?

Save your project

Step 5: Game over

Let's add a 'game over' message at the end of the game.

Activity Checklist

- If you haven't already, create a new variable called **lives**. Your spaceship should start with 3 lives and lose a life whenever it collides with an enemy. Your game should also stop when you run out of lives. If you need help, you can use the 'Catch the Dots' project to help you.
- Draw a new sprite called 'Game Over', using the text tool.

- On your stage, broadcast a **game over** message just before the game ends.

- Add this code to your 'Game Over' sprite, so that the message shows at the end of the game:

Because you've used a **broadcast [game over] and wait** block on your stage, it will wait for the 'Game Over' sprite to be displayed before ending the game.

- Test your game. How many points can you score? Can you think of ways to improve your game if it is too easy or too hard?
